## A perfect floor starts here

### About this product

Developed for use in high profile areas where the ultimate “wet look” gloss and durability are desired. Its high solid content builds the required film thickness with fewer coats. Water-based, it can safely be used on all types of flooring. Designed to resist scuffs and black heel marks, it is easy to maintain and responds well to high-speed burnishing. It is an excellent choice for high traffic areas as its fast drying formula keeps the down-time to a minimum. With its 20% solids content formula, it is easy to spread while reducing the risk of mop swirls or uneven gloss – leaving you with the perfect floor with a gloss rating of 87%.\*

- Long lasting high gloss shine
- Excellent slip resistance
- Detergent resistant
- Scuff and black mark resistant
- Non-yellowing
- Safe for all types of flooring
- 20% solids content
- Good leveling
- No odour
- ECOLOGO Certified (UL 2777)
- Coverage per 4 L is 1600 ft<sup>2</sup> to 2500 ft<sup>2</sup>

### How does a floor finish work?

The solids in a floor finish are what are left on the floor when you apply finish. Once the floor finish is applied, the liquids evaporate leaving behind the protective coating. When you use a finish with a higher amount of solids, obviously there is more material left on the floor, meaning better gloss and protection for your floor.

While this sounds like an obvious choice, there are many factors to consider. Floor finishes with a solids content of 25% and above are thicker and more difficult to apply and fix. This can result in uneven gloss, mop swirls and cause very thick patches of finish that take a long time to dry. Also, because of the additional solids content, the price for these floor finishes are higher and the same results can be achieved with a floor finish of 25% and lower with just a few extra coats! Save yourself the hassle!
